Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (currently amended): A switch for a telecommunications network comprising:

at least one fabric for switching PVx (permanent virtual) connections;

at least one input mechanism for receiving PVx connections from the network;

a plurality of output mechanisms for sending PVx connections to the network, with at least one of the output mechanisms non-modifiable; and

a controller which <u>dynamically</u> modifies parameters for the connections of the fabric, the input mechanism, and <u>the plurality of the output mechanisms except for the non-modifiable output mechanism based on a modify signal, the controller modifying the non-modifiable output mechanism by destroying [[them]] <u>the connections of the non-modifiable output mechanism</u> and then recreating the PVx connections of the non-modifiable output mechanism <u>subject to the modified parameters</u> while the input mechanism, output <u>mechanism mechanisms</u>, fabric and connections are active and operating.</u>

Claim 2 (original): A switch as described in Claim 1 wherein cells of a connection of the

non-modifiable output mechanism that is modified are discarded after the connection is

destroyed and until the connection is recreated.

Claim 3 (original): A switch as described in Claim 2 wherein the input mechanism is an

input netmod.

Claim 4 (original): A switch as described in Claim 3 wherein the output mechanism is an

output netmod.

Claim 5 (currently amended): A method for handling connections in a

telecommunications network comprising the steps of:

sending a modify signal for modifying parameters regarding connections in the network

to a switch having at least one fabric for switching PVx (permanent virtual) connections, at least

one input mechanism for receiving PVx connections from the network, and a plurality of output

mechanisms for sending PVx connections to the network, with at least one of the output

mechanisms non-modifiable;

modifying dynamically the parameters regarding the connections of the fabric, the input

mechanism and the plurality of output mechanisms except for the non-modifiable output

mechanism;

destroying the connections of the non-modifiable output mechanism; and

Page 3 of 10

recreating the connections of the non-modifiable output mechanism subject to the modify parameters.

Claim 6 (original): A method as described in Claim 5 wherein the recreating step includes the step of recreating the connections within 50 milliseconds.

Claim 7 (original): A method as described in Claim 6 including the step of the discarding cells of the connections of the non-modifiable output mechanism after they have been destroyed and until they are recreated.

Claim 8 (currently amended): A switch for a telecommunications network comprising:

at least one fabric for switching SVx (switched virtual) connections;

at least one input mechanism for receiving SVx connections from the network;

a plurality of output mechanisms for sending SVx connections to the network, with at least one of the output mechanisms non-modifiable; and

a controller which <u>dynamically</u> modifies parameters for the connections of the fabric, the input mechanism, and <u>the plurality of the output mechanisms except for the non-modifiable output mechanism based on a modify signal, the controller modifying the non-modifiable output mechanism by destroying [[them]] <u>the connections of the non-modifiable output mechanism</u> and then recreating the SVx connections of the non-modifiable output mechanism <u>subject to the modified parameters</u> while the input mechanism, output <u>mechanism mechanisms</u>, fabric and connections are active and operating.</u>

Claim 9 (currently amended): A method for handling connections in a

telecommunications network comprising the steps of:

sending a modify signal for modifying parameters regarding connections in the network

to a switch having at least one fabric for switching SVx (switched virtual) connections, at least

one input mechanism for receiving SVx connections from the network, and a plurality of output

mechanisms for sending SVx connections to the network, with at least one of the output

mechanisms non-modifiable;

modifying dynamically the parameters regarding the connections of the fabric, the input

mechanism and the plurality of output mechanisms except for the non-modifiable output

mechanism;

destroying the connections of the non-modifiable output mechanism; and

recreating the connections of the non-modifiable output mechanism subject to the modify

parameters.

Claim 10 (new): A switch as described in Claim 4 wherein parameters are associated

with a specific QOS (quality of service) and modified parameters are a different QOS.

Claim 11 (new): A switch as described in Claim 9 wherein parameters are associated

with a specific QOS (quality of service) and modified parameters are a different QOS.

Appl. No. 10/700,206 Amdt. dated October 11, 2007 Reply to Office action of July 12, 2007

Claim 12 (new): A method as described in Claim 7 wherein the parameters are associated with a specific QOS (quality of service) and the modifying step includes the step of modifying the specific QOS.

Claim 13 (new): A method as described in Claim 9 wherein the parameters are associated with a specific QOS (quality of service) and the modifying step includes the step of modifying the specific QOS.
